PROJECT IDEA | EDUCATION × AI

LERNWIRKSAM
AI & INSTRUCTIONAL DESIGN

Solve concrete learning problems.
Reduce the burden on teaching and training teams.
Strengthen independent competence.

For schools, adult education, corporate learning and vocational training.

STARTING POINT

AI alone does not mean learning has occurred.

Quick AI outputs can obscure whether people truly understand and can apply what they have learned.

THREE QUESTIONS: What should learners be able to do independently? When does AI help, and when does it not? How will we recognize learning?
Principle: start with the learning problem, not the technology. A good non-AI solution remains a valid option.

APPROACH

One learning module. One clear benefit.

Rather than building a proprietary platform from the outset, the project starts with existing learning materials.

01 Understand needs: clarify the learning bottleneck, target group and starting point.
02 Enable the team: build practical rules and competencies.
03 Design the module: improve practice, feedback and reflection.
04 Test learning support: provide hints instead of finished solutions, with professionals still involved.
05 Evaluate value: assess learning and effort together.

AREAS OF APPLICATION

Where people genuinely learn.

Schools and higher education: independent reasoning and subject-specific justification.
Adult education: learner-centered practice and transparent AI use.
Corporate learning: team upskilling and practical learning modules.
Blue-collar learning: support for onboarding, vocational education and work processes.

The instructional approach is shared, but needs and budgets must be validated separately by sector.

PILOT CONCEPT

Start small. Learn from evidence.

Two possible pilot paths are being considered separately; no contract has yet been agreed.

A / EDUCATION PILOT: revise an existing learning offer through a short team workshop, one module, a practical test and a joint review. Goal: independent explanation and application.
B / WORKFORCE TRAINING: address a specific onboarding or vocational-training problem using a short, potentially multilingual module. Specialist approval and human guidance remain essential.
Criteria: practical application, independence, time required, accessibility and quality of feedback.

LOOKING AHEAD

Education, sustainability and international exchange.

A possible research direction connects education for sustainable development (ESD), biodiversity and the South American concept of Buen Vivir with responsible digital learning design.

RESEARCH: builds on an earlier DBU-supported doctoral project; not yet an approved new research project.
INTERNATIONAL & INTERDISCIPLINARY: collaboration in German, English and Spanish. The AI-supported Karrierekompass career and learning assistant is a separate development project.

DIALOGUE & COLLABORATION

Which learning problems should we solve first?

I am looking to exchange ideas with schools, education providers, universities, corporate L&D teams and potential research partners.

THREE QUESTIONS FOR PRACTICE: 1. Where does learning fail in concrete terms today? 2. Why is the existing solution insufficient? 3. What would count as progress?
I welcome pointers, critical counterarguments and conversations about a clearly scoped pilot.
